

Games with names

Nikos Tzevelekos

Queen Mary, University of London

What this talk is about

Generation of **new resources** is a pervasive feature in computation
(references, objects, channels, etc.)

We see resources as **names**

We show how to use **game semantics**
to capture computation with names

Computation with names

```
 $\lambda x. \text{ref}(\theta) : \text{com} \rightarrow \text{intref}$ 
```

```
let f = [_] in { f() == f() }
```

Computation with names

```
λx.ref(0) : com → intref
```

```
let f = [_] in { f() == f() }
```

Computation with names

```
 $\lambda x. \text{ref}(\theta) : \text{com} \rightarrow \text{intref}$ 
```

```
let f = [_] in { f() == f() }  $\mapsto$  false
```

Example: Reduced ML

basic programming language with
functions + integer references

$$P \cong P'$$

equivalent behaviour in every context

Example: Reduced ML

basic programming language with
functions + integer references

$$\text{let } x = \text{ref}(0) \text{ in } \lambda y. (x == y) \quad \cong \quad \lambda y. \text{false} : \text{intref} \rightarrow \text{int}$$

Example: Reduced ML

basic programming language with
functions + integer references

$\text{let } x = \text{ref}(0) \text{ in } \lambda y. (x == y) \cong \lambda y. \text{false} : \text{intref} \rightarrow \text{int}$

$\lambda y. \text{ref}(0) \not\cong \text{let } x = \text{ref}(0) \text{ in } (\lambda y. x) : \text{com} \rightarrow \text{intref}$

Example: Reduced ML

basic programming language with
functions + integer references

$$\text{let } x = \text{ref}(0) \text{ in } \lambda y. (x == y) \quad \cong \quad \lambda y. \text{false} : \text{intref} \rightarrow \text{int}$$
$$\lambda y. \text{ref}(0) \quad \not\cong \quad \text{let } x = \text{ref}(0) \text{ in } (\lambda y. x) : \text{com} \rightarrow \text{intref}$$
$$f : \text{intref} \rightarrow \text{int} \vdash \lambda y. f(\text{ref}(0))$$
$$\cong \text{let } x = \text{ref}(0) \text{ in } \lambda y. x := 0; f(x) : \text{com} \rightarrow \text{int}$$

Two ways to model references

Reynolds

- *Idealized Algol (1978)*

References are *pairs*:

`intref =`
`(com → int) × (int → com)`

$\longmapsto (\mathbf{1} \rightarrow \mathbf{Z}) \times (\mathbf{Z} \rightarrow \mathbf{1})$

Two ways to model references

Reynolds

- *Idealized Algol (1978)*

References are *pairs*:

$\text{intref} =$
 $(\text{com} \rightarrow \text{int}) \times (\text{int} \rightarrow \text{com})$

$\longmapsto (\mathbf{1} \rightarrow \mathbf{Z}) \times (\mathbf{Z} \rightarrow \mathbf{1})$

- Theoretically attractive
- but: $\text{mkvar}(\lambda x. 3, \lambda x. ())$
(*bad variables*)

Two ways to model references

Reynolds

- *Idealized Algol (1978)*

References are *pairs*:

`intref =`
`(com \rightarrow int) \times (int \rightarrow com)`
 \longmapsto `(1 \rightarrow Z) \times (Z \rightarrow 1)`

- Theoretically attractive
- but: `mkvar($\lambda x.3, \lambda x.()$)`
(*bad variables*)

Pitts & Stark

- *nu-calculus (1993)*

References are *names*:

`intref = base type`
 \longmapsto `N (names)`

Two ways to model references

Reynolds

- *Idealized Algol (1978)*

References are *pairs*:

`intref =`
`(com \rightarrow int) \times (int \rightarrow com)`
 \longmapsto `(1 \rightarrow Z) \times (Z \rightarrow 1)`

- Theoretically attractive
- but: `mkvar($\lambda x. 3, \lambda x. ()$)`
(*bad variables*)

Pitts & Stark

- *nu-calculus (1993)*

References are *names*:

`intref = base type`
 \longmapsto `N (names)`

- Notion of *resource (name)*:
 - atomic values
 - infinitely many
 - comparable for equality

Bad variables

- Many pairs of ref type are *not* references
 - e.g. `mkvar($\lambda x.3, \lambda x.()$)`
- no notion of *reference equality test*
- spurious non-equivalences:

`x := 0; !x` vs. `x := 0; 0`

`x := 0; x := 1` vs. `x := 1`

Game Semantics

How can we reason about:

$$P \cong P'$$

Game Semantics

- Computation is modelled as a 2-player game between:
 - *Proponent* (the program)
 - *Opponent* (the environment)

Example

$\lambda x. x+1 : \text{int} \rightarrow \text{int}$

$1 \longrightarrow \text{Int} \rightarrow \text{Int}$

Nominal game semantics (2004-)

Nominal sets

Think of a universe of *nominal sets*:

- there is a countably infinite set \mathcal{N} of **names**
- all sets involve a **finite amount** of names

Nominal sets

Think of a universe of *nominal sets*:

- there is a countably infinite set \mathcal{N} of **names**
- all sets involve a **finite amount** of names

Formally, a nominal set X consists of:

- a carrier set X
- an action $\bullet : \text{PERM}(\mathcal{N}) \times X \longrightarrow X$
 - e.g. $(n_1 n_2) \bullet n_1 n_1 n_2 n_1 = n_2 n_2 n_1 n_2$
- all elements of X have **finite support**

Nominal sets

Foundation for maths with
names and **name-binding**

- direct models

Achievements

Achievements

Quotiented models

- AGMOS 04, Laird 04: nu-calculus
- Tz. 07, 08: HO references, exceptions, ...

$$M \cong N \iff \llbracket M \rrbracket \cong \llbracket N \rrbracket$$

Quotiented models

- AGMOS 04, Laird 04: nu-calculus
- Tz. 07, 08: HO references, exceptions, ...

$$M \cong N \iff \llbracket M \rrbracket \cong \llbracket N \rrbracket$$

$$\llbracket A \rightarrow B \rrbracket = \llbracket A \rrbracket \Rightarrow (S \Rightarrow \llbracket B \rrbracket \otimes S)$$

$$S = \bigotimes_A (N_A \Rightarrow \llbracket A \rrbracket)$$

Quotiented models

- AGMOS 04, Laird 04: nu-calculus
- Tz. 07, 08: HO references, exceptions, ...

$$M \cong N \iff \llbracket M \rrbracket \cong \llbracket N \rrbracket$$

Characteristics:

- moves involving names
- moves-with-state (a set/list of names)
- “functional” behaviour + monads for effects

Direct models

- Laird 06: higher-order channels
Laird 08: pointers
- Mu.Tz. 09: integer references (Reduced ML)
Mu.Tz. 11: HO references

$$M \cong N \iff \text{comp}(\llbracket M \rrbracket) = \text{comp}(\llbracket N \rrbracket)$$

Direct models
